

## Deadlock characterization:

- 1) Mutual exclusion :- only one process at a time can use resource
  - 2) Hold & wait :- Process is holding one resource and waiting to hold another resource held by other process
  - 3) No preemption :-
  - 4) Circular wait :- if there are 3 processes given  $P_1, P_2, P_3$  so,  $P_1$  is waiting for the resources held by  $P_2$ .  
 $P_2$  is waiting for the resources held by  $P_3$ .  
 $P_3$  is waiting for the resources held by  $P_1$ .
- \* Example of Banker's Algorithm.
- 5 processes  $P_0$  through  $P_4$ , 3 processes types:
  - $A$  (10 instances),  $B$  (5 instances), and  $C$  (7 instances)
  - Snapshot at time  $T_0$

	Allocation			Max	Available	Need
	A	B	C	A	B	C
$P_0$	0 1 0	7 5 3	3 3 2	7 4 3		
$P_1$	2 0 0	3 2 2		1 2 2		
$P_2$	3 0 2	9 0 2	6 0 0			
$P_3$	2 1 1	2 2 2	0 1 1			
$P_4$	0 0 2	4 3 3	4 3 1			

→ To prevent the deadlock in the system, we have to find the safety sequence of execution.

How will you calculate the need.

DATE	/ /

o) we have to apply following too algorithm for Banker's

→ 1) Safety algorithm

2) Request Resources - Request algorithm.

if need  $\leq$  available  
then

execute process

new-available = available + allocation

else

do not execute go forward and execute next process.

need = max-allocation

→ 2) Request Resources - Request algorithm.

Condition

1. Request  $\leq$  need

2. if Request  $\leq$  Available.

if both Condition are true then

Available = Available - Request;

Allocation = Allocation + Request;

Need; = Need; - Request;

o) Need of P<sub>0</sub>  $\leq$  available

$$743 \leq 332$$

P<sub>0</sub> will not execute.

o) Need of P<sub>1</sub>  $\leq$  332

P<sub>1</sub> will execute.

$$\text{new-available} = 332 + 200 \text{ (Allocation of P}_1\text{)} = 532$$

o) Need of P<sub>2</sub>  $\leq$  532

P<sub>2</sub> will not execute.

$$600 \leq 532$$

•) Need of  $P_3 \leq 532$  available = 532

$011 \leq 532$   $P_3$  will execute.

$$\text{new-available} = 532 + 211 \text{ (allocation of } P_3) = 743$$

•) Need of  $P_4 \leq 532 \leq 743$

$$431 \leq 743$$

$$\text{new-available} = 743 + 002 \text{ (allocation of } P_4) = 745$$

$P_4$  will execute.

•) Need of  $P_0 \leq 745$

$$745 \stackrel{(3)}{\leq} 745$$

$$\text{new-available} = 745 + 010 \text{ (allocation of } P_0) = 755$$

$P_0$  will execute.

•) Need of  $P_2 \leq 600$

$$600 \leq 755$$

$$\text{new-available} = 755 + 302 \text{ (allocation of } P_2) = 1057$$

$P_2$  will execute.

Safety sequence for given problem is  $\langle P_1, P_3, P_4, P_0, P_2 \rangle$

- Q. if Process  $P_1$  request 102 number of resources, can this sequence will be granted.

request  $\leq$  need

$$102 \leq 122 \text{ (outcome is true)}$$

request  $\leq$  available

$$102 \leq 332 \text{ (outcome is true)}$$

$$\text{Available} = \text{Available} - \text{request}$$

$$\begin{aligned} &= 332 - 102 \\ &= 230 \end{aligned}$$

Allocation = Allocation + request ;  $\rightarrow$  available

$$\text{Allocation} = 200 + 102 = 302$$

$$\text{Allocation} = 302 \leq \text{available} = 300$$

Need, = Need - request ;

$$= 122 - 102 = 020 \rightarrow \text{available}$$

$$020 \leq \text{available}$$

if two conditions are true then  $P_i$  request will be granted.

check the  $\text{request} \leq \text{Available}$  (that is  $(102) \leq (302)$ )

~~Request < Available~~

Allocation Max Need Available

ABC ABC ABC ABC

P<sub>0</sub> 010 753 743 230

P<sub>1</sub> 302 322 020 020

P<sub>2</sub> 302 902 600 600

P<sub>3</sub> 211 222 011 011

P<sub>4</sub> 002 433 431 431

→ executing safety algorithm show that sequence  $\leftarrow P_1, P_3, P_4, P_0, P_2$  satisfy safety requirement.

• Can request for (330) by P<sub>4</sub> be granted?

• Can request for (0,2,10) by P<sub>0</sub> be granted?

i) Request  $\leq$  need

$$230 \leq 431$$

ii) Request  $\leq$  need

$$\text{true } 020 \leq 743 \\ \text{true}$$

Answer the following questions

- i) Determine the total amount of resources of each type
- ii) what is the content of need matrix?
- iii) Determine the system is in the safe state using safety algorithm
- iv) if a request from Process P1 arrives for [1,1,0] Can the request be granted immediately.

### \* Example of Detection Algorithm

- five processes P<sub>0</sub> through P<sub>4</sub>; three resources type A (7 instances), B (2 instances), C (6 instances)
- Snapshot at time T<sub>0</sub>:

	Allocation	Request	Available
P <sub>0</sub>	0 1 0	0 0 0	0 0 0
P <sub>1</sub>	2 0 0	2 0 2	
P <sub>2</sub>	3 0 3	0 0 0	0 0 1
P <sub>3</sub>	2 1 1	1 0 0	
P <sub>4</sub>	0 0 2	0 0 2	

$$\rightarrow \text{work} = \text{available} = 0 0 0$$

is request P<sub>0</sub>  $\leq$  available P<sub>0</sub>

$$\text{work} = \text{work} + \text{allocation P}_0 = 0 0 0 + 0 1 0 = 0 1 0$$

$$\rightarrow \text{work} = \text{available} = 0 1 0$$

is request P<sub>1</sub>  $\leq$  available P<sub>1</sub>

$$2 0 2 \leq 0 0 0$$

No X P<sub>1</sub> not executed

$\rightarrow$  work = available = 0.10  $\leq$  request P<sub>2</sub>  $\leq$  available P<sub>2</sub>  $\Rightarrow$  allocation of 0.00  $\leq$  0.10 but no attempt P<sub>2</sub> will exec

$\rightarrow$  work = work + allocation of P<sub>2</sub>  $\Rightarrow$  available P<sub>2</sub> = 0.10 + 0.03  $\Rightarrow$  available P<sub>2</sub> = 0.13

(0.1, 0.1) work = 0.13  $\leq$  request P<sub>3</sub>  $\leq$  available P<sub>3</sub>  $\Rightarrow$  allocation of 0.00  $\leq$  0.13 but no attempt P<sub>3</sub> will exec

$\rightarrow$  work = available = 0.13  $\leq$  request P<sub>3</sub>  $\leq$  available P<sub>3</sub>  $\Rightarrow$  allocation of 0.00  $\leq$  0.13 but no attempt P<sub>3</sub> will exec

$$0.00 \leq 0.13$$

true P<sub>3</sub> will exec

work = 0.13 + 0.11 = 0.24  $\leq$  available P<sub>4</sub>

allocation = 0.24  $\leq$  available P<sub>4</sub>  $\Rightarrow$  allocation of 0.00  $\leq$  0.24 but no attempt P<sub>4</sub> will exec

$\rightarrow$  work = available = 0.24  $\leq$  request P<sub>4</sub>  $\leq$  available P<sub>4</sub>  $\Rightarrow$  allocation of 0.00  $\leq$  0.24 but no attempt P<sub>4</sub> will exec

allocation = 0.02  $\leq$  0.24  $\Rightarrow$  allocation of 0.02  $\leq$  0.24 true P<sub>4</sub> will exec

$$\text{work} = 0.24 + 0.02$$

$$= 0.26$$

$\rightarrow$  work = available = 0.26  $\leq$  request P<sub>1</sub>  $\leq$  available P<sub>1</sub>  $\Rightarrow$  allocation of 0.00  $\leq$  0.26 but no attempt P<sub>1</sub> will exec

$$0.00 \leq 0.26$$

true P<sub>1</sub> will exec

$$\text{work} = 0.26 + 0.00$$

$$= 0.26$$

$\rightarrow$  for avoiding deadlock follow this sequence

P<sub>0</sub>  $\rightarrow$  P<sub>1</sub>  $\rightarrow$  P<sub>2</sub>  $\rightarrow$  P<sub>3</sub>  $\rightarrow$  P<sub>4</sub>  $\rightarrow$  P<sub>0</sub>  $\rightarrow$  P<sub>1</sub>  $\rightarrow$  P<sub>2</sub>  $\rightarrow$  P<sub>3</sub>  $\rightarrow$  P<sub>4</sub>  $\rightarrow$  P<sub>0</sub>  $\rightarrow$  P<sub>1</sub>  $\rightarrow$  P<sub>2</sub>  $\rightarrow$  P<sub>3</sub>  $\rightarrow$  P<sub>4</sub>  $\rightarrow$  P<sub>0</sub>

Allocation  $\rightarrow$  allocation  $\rightarrow$  allocation

Allocation  $\rightarrow$  Allocation  $\rightarrow$  Allocation

Allocation  $\rightarrow$  Allocation

following previous table by changing (Request P2 = 00)

- By changing this process, only one process will execute. rest of the all processes will not execute. then it will create a deadlock.

## \* Recovery from Deadlock :- Resources Preemption.

1) selecting a victim :-

Victim process from which we can take away resources and allocate to another process.

2) rollback :-

return to some safe state, restart process for that state

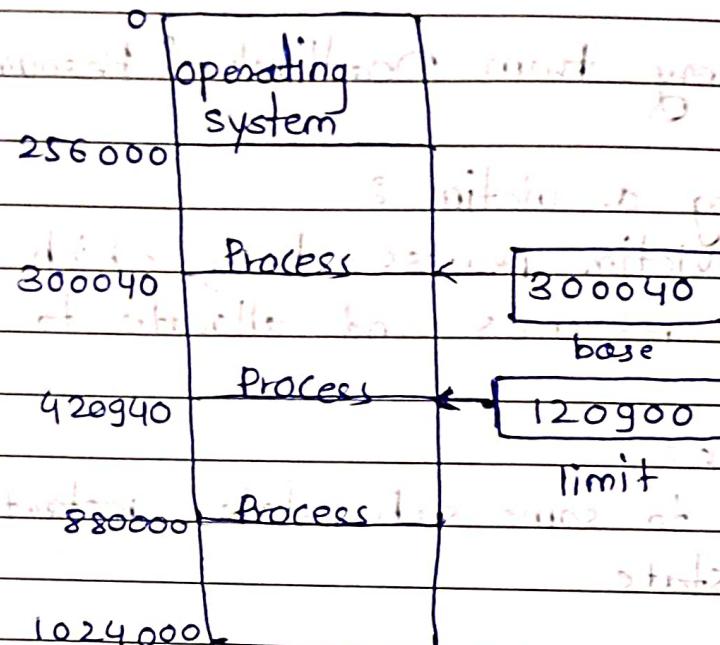

3) starvation :-

same process may always be picked as victim, include no. of rollback in cost factor.

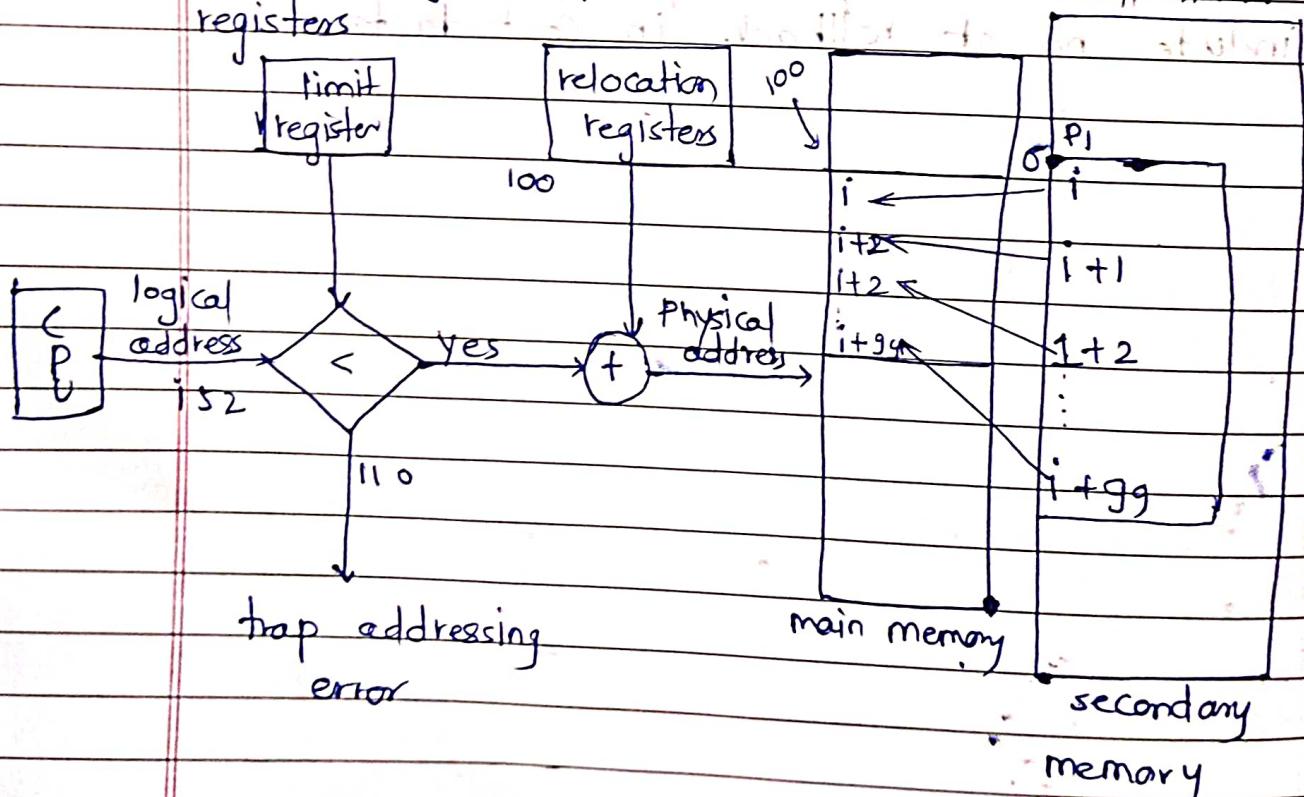

## 4. Memory Management

DATE NO. \_\_\_\_\_  
DATE 24/2/23

- \* Base and limit Registers are often paired together. This pairing allows us to store both base and limit values.
- \* A pair of base and limit registers define the logical address space.

- \* Hardware support for relocation and limit registers.

The label for the diagram is Paging (logical to physical).

- CPU will throw always logical address of secondary memory instruction
- for e.g. 152 instruction will be called from given process
- instruction no. should be lesser than the limit register value.
- if condition is true then relocation register will calculate the physical address of the process by adding base address into it.

e.g. - base = 100

- so if, the base register is having address 100  
So the physical address is 152
- This process is called ~~as~~ - paging.

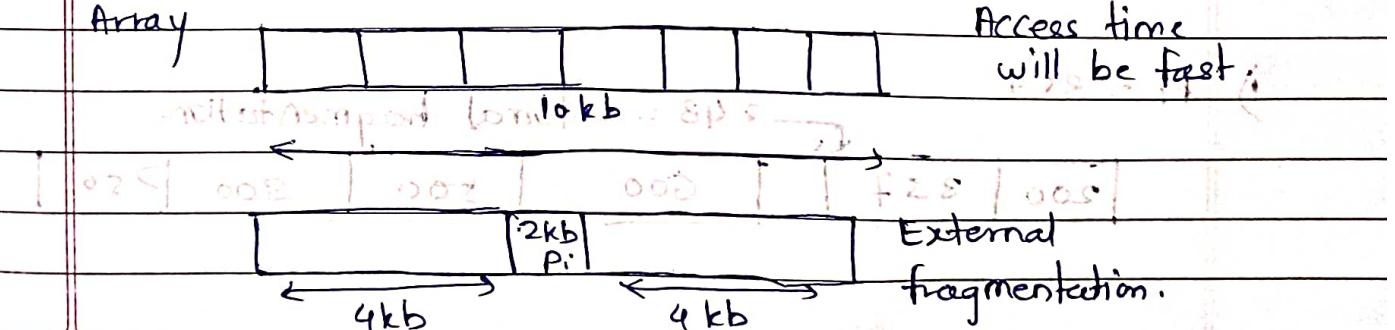

- Program will divided into several no. of parts core (called as frames)
- frames are located onto secondary memory
- frames are mapped onto pages of primary memory  
so, pages are located onto the primary memory.

### → Contiguous Allocation - fragmentation.

These are two types.

- Internal fragmentation (Block size is greater than allocation)
- External fragmentation (Block size is less than allocation)

Array

p<sub>2</sub> = 5kb

space not available.

→ 1. 5 kb is external fragmentation with memory allocation with internal fragmentation.

internal fragmentation: with allocation of 5 kb of memory.

there will be wasted and there is no utilization of memory.

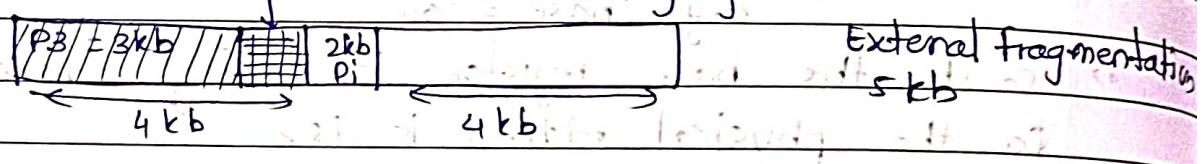

Array

allocation of memory with size of 5 kb will be fast.

size of memory to 10 kb will be latency with still.

High memory usage

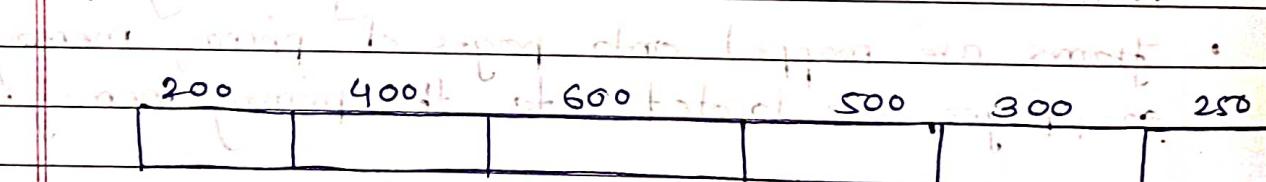

1 kb = Internal fragmentation

$P_2 = 5 \text{ kb}$  → X (not available)  
space not available.

→ now we can see that it is internal fragmentation.

Ques: Apply first, best, worst fit on given memory partitions.

with fragmentation - with better algorithm

$$P_1 = 357$$

(Best fit)

$P_2 = 210$  → 1. 1st fit with fragmentation (worst fit).

$P_3 = 468$  → 2nd fit with fragmentation (worst fit).

$$P_4 = 491$$

with worst fit

$$1) P_1 = 357$$

$\rightarrow 43 = \text{Internal fragmentation.}$

with better fit

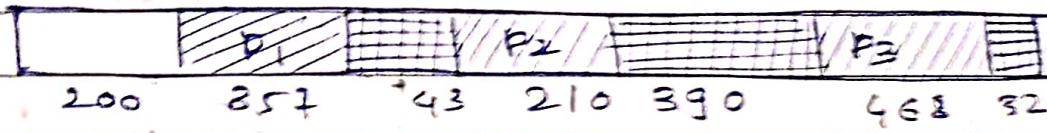

defragmentation →  $210 + 468 = 678$  →  $678 - 400 = 278$

200 357 43

322

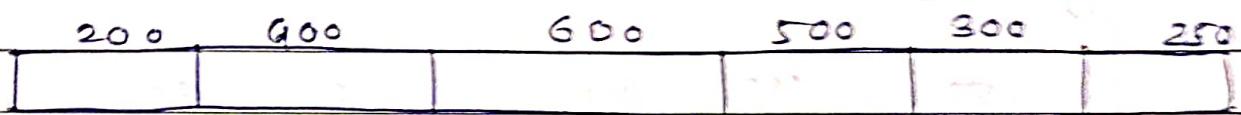

221

78

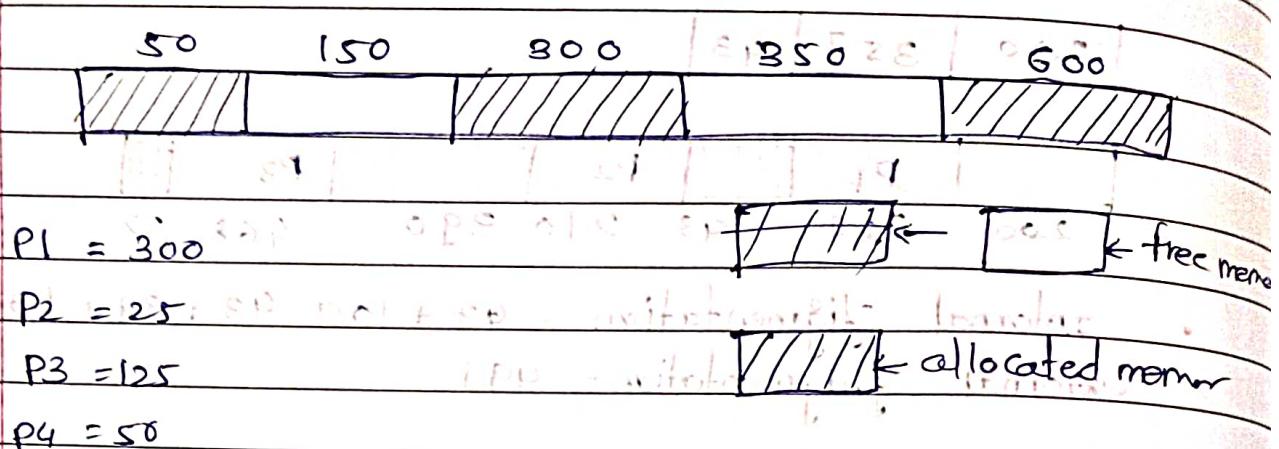

- internal fragmentation =  $43 + 109 + 43 + 390 + 32$
- external fragmentation = 491

## 2) Best fit

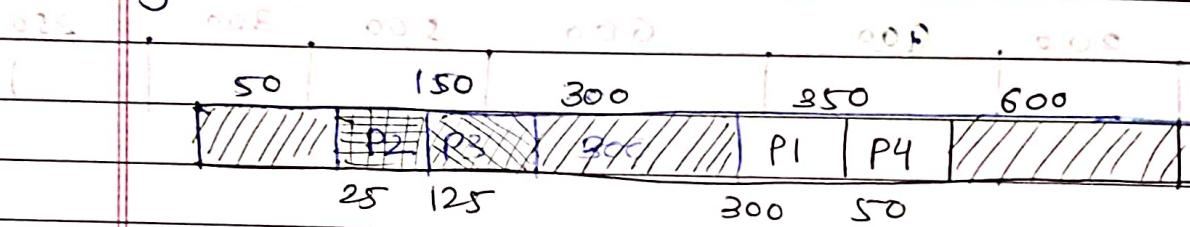

- internal fragmentation =
- external fragmentation =

a. calculate Internal and External fragmentation

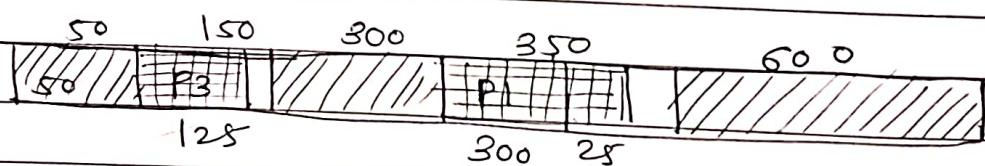

→ first fit.

Internal fragmentation = 0

External fragmentation = 80

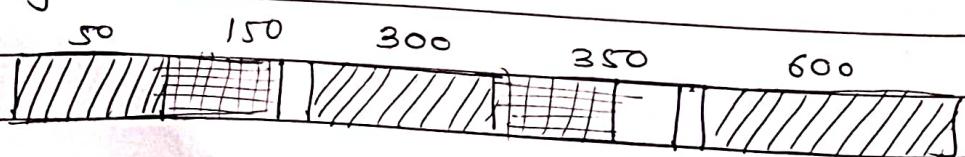

→ Best fit

Internal fragmentation = 0

External fragmentation = 50

→ Worst fit.

Internal fragmentation = 0

External fragmentation = 0

Q. Pogggin on logical to physical addresses.

PAGE NO.	
DATE	/ /

## \* logical address to physical Address

- 1) CPU will call logical address of the page with offset id. → e.g.

P2	D <sub>35</sub>
----	-----------------

This is called as logical address.

- 2) There is process which has 3 Pages, page p<sub>1</sub>, p<sub>2</sub>, p<sub>3</sub>. These three pages are distributed on main memory at various frames
- 3) either the frames are Continuous or non-Continuous
- 4) The page table is created or design to locate the physical address of the page and each page will be mapped on to the respective frame number
- 5) Page is referred on secondary memory which is the logical address
- 6) Frame is referred on primary memory which is the physical address of the page.

This process is called as pogggin and this is how the logical address to physical address takes place.

Page 0	Page 1	Page 2	Page 3	Page 0	Page 1	Page 2	Page 3
0	P1	1	P2	1	Page 0

page hit  
↑  
page  
hit.

## optimal Page Replacement.

1	2	3	4	1	2	5	1	2	3	4	5
1	1	1	1	1	1	1	1	1	1	4	4
2		2	2	2	2	2	2	2	2	2	2
3		3	3	3	3	3	3	3	3	3	3
4			4	4	4	5	5	5	5	5	5
							↑	↑	↑	↑	↑

- Replace the page when there will be page fault
- The page which will come after the long run on the remaining reference from string

frame size = 4

page hit = 6      total no of references = 12

page fault =  $6 - 4 = 2$        $12 - 6 = 6$

page fault ratio =  $(6/12) \times 100 = 50\%$

50 %

example there are 7 pages and 4 frames. Calculate number of pages fault / pages miss and page fault ratio.

Reference string

1 2 3 4 2 1 5 6 2 1 2 3 7 6 3 2 1 2 3 6

1) LRU FCFS Method (first in first out)

1	2	3	4	2	1	5	6	2	1	2	3	7	6	3	2	1	2	3	6
1	1	1	1	1		5	5	5	5		3	3	3		3	1	.	1	
2		2	2			2	6	6	6		6	7	7		7	7		3	
3			3	3		3	3	2	2		2	2	6		6	6		6	
4				4		4	4	4	1		1	1	1		2	2	.	2	
					↑	↑			↑	↑	↑	↑				↑	.	↑	

frame size = 4

Page hit = 6 Total no of refere = 20

page fault =  $6 - 4 = 2$   $20 - 6 = 14$

page fault ratio =  $(14/20) \times 100 = 70\%$

2) LRU (stack method)

1	2	3	4	2	1	5	6	2	1	2	3	7	6	3	2	1	2	3	6
1	1	2	3	4	2	1	5	6	2	1	2	3	7	6	3	2	1	2	3
2		1	2	3	4	2	1	5	6	2	1	2	3	7	6	3	2	1	2
3			1	2	3	4	2	1	5	6	6	1	2	3	7	6	3	2	1
4				1	2	3	4	2	1	5	5	6	1	2	2	7	6	6	1
					↑	↑			↑	↑	↑				↑	↑	↑	↑	

frame size = 4

Page hit = 10

Total no of references = 20

Page fault =  $20 - 10 = 10$

Page fault ratio =  $(10/20) \times 100 = 50\%$

### 3) LRU (Counting method)

	1	2	3	4	2	1	5	6	2	1	2	3	7	6	3	2	1	2	3	6
1	1	2	3	4	2															
2			2	3	4															
3			1	2	3															
4			1	2																

### 4) optimal

	1	2	3	4	2	1	5	6	2	1	2	3	7	6	3	2	1	2	3	6
1	1	1	1	1	1		51	51					7		1		1			
2		2	2	2			2	62					62		2					
3		3	3				3	3					3		3					
4			4				5	6					6		6					

↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑

page hit = 12

total Refer = 20

page fault =  $20 - 12 = 8$

page fault ratio =  $\frac{8}{20} \times 100 = 40\%$

### 3) LRU Counting method.

P/R	1	2	3	4	2	1	5	6	2	1	2	3	7	6	3	2	1	2	3
1	1	2	3	4	4	1	2	3	4	1	2	3	4	0	0	0	1	2	3
2		1	2	3	1	2	3	4	1	2	1	2	3	4	0	1	2	1	2
3		1	2	3	4	0	0	0	0	0	1	2	3	1	2	3	4	3	1
4		1	2	3	4	0	0	0	0	0	0	0	0	0	0	0	0	0	0
5						1	2	3	4	4	0	0	0	0	0	0	0	0	0
6							1	2	3	3	4	4	0	1	2	3	4	4	0
7													1	2	3	4	0	0	0

Example-3 Calculate page fault/miss and page hit for FIFO, LRU, OPTIMAL, Consider frame size = 3

6 0 5 2 0 3 0 4 2 3 0 3 2 5 2 0 5 6 0 5

LRU

6

Op

optimal

	6	0	5	2	0	3	0	4	2	3	0	8	2	5	2	0	5	6	0	5
1	6	6	6	2		2		2		2	2			2				6		
2	0	0	0	0	0	0	4			0	0		0	0			0	0		
3		5	5	5	3	3		3		3		5				5		5		5

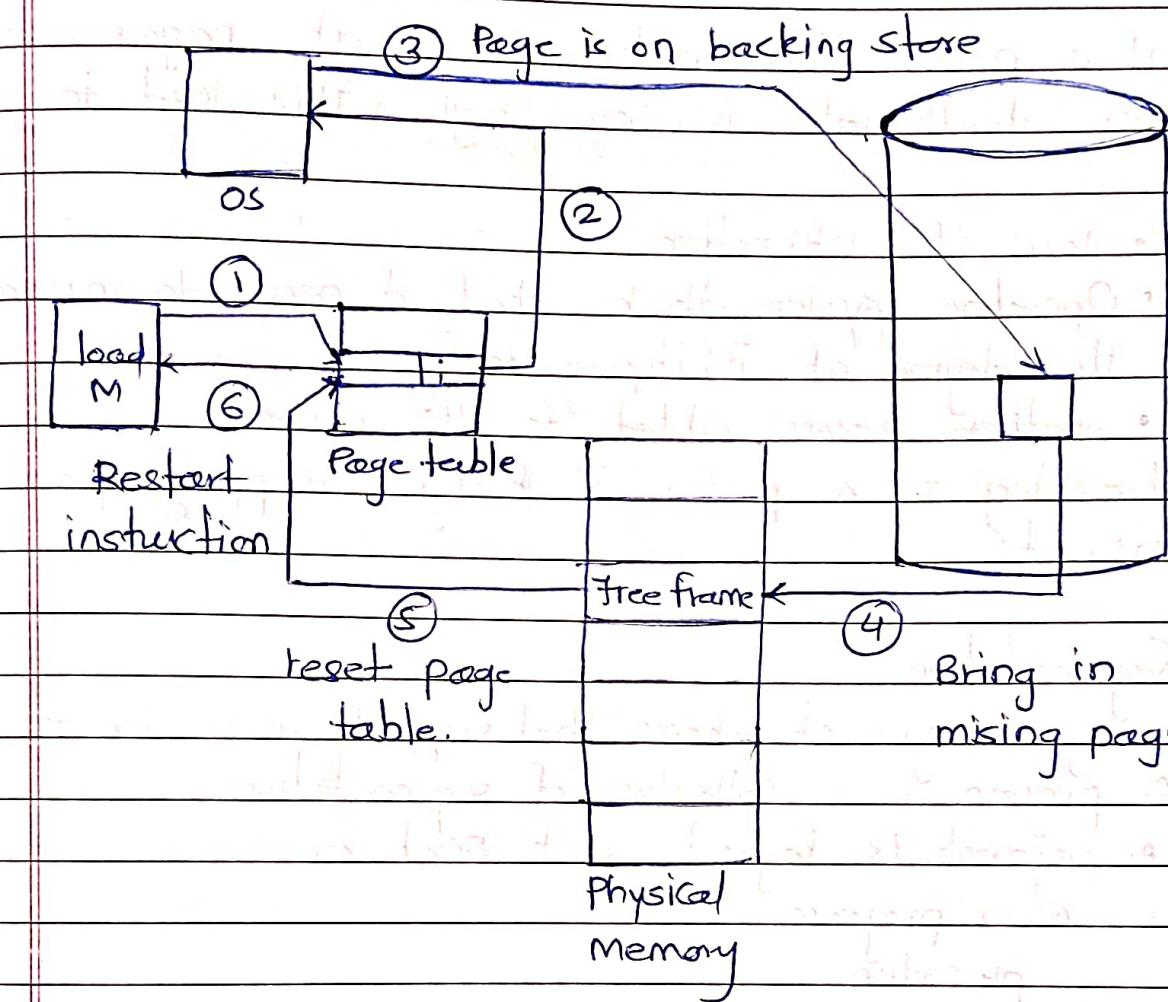

$$\text{Page bit} = 11$$

$$\text{total refer} = 20$$

$$\text{Page fault} = 20 - 11 = 9$$

$$\text{Page fault ratio} = \frac{9}{20} \times 100 =$$

~~Ans~~ steps in handling a page fault.

→ Page table written some pages are not in main memory.

⇒ Page fault rate will increase → memory.

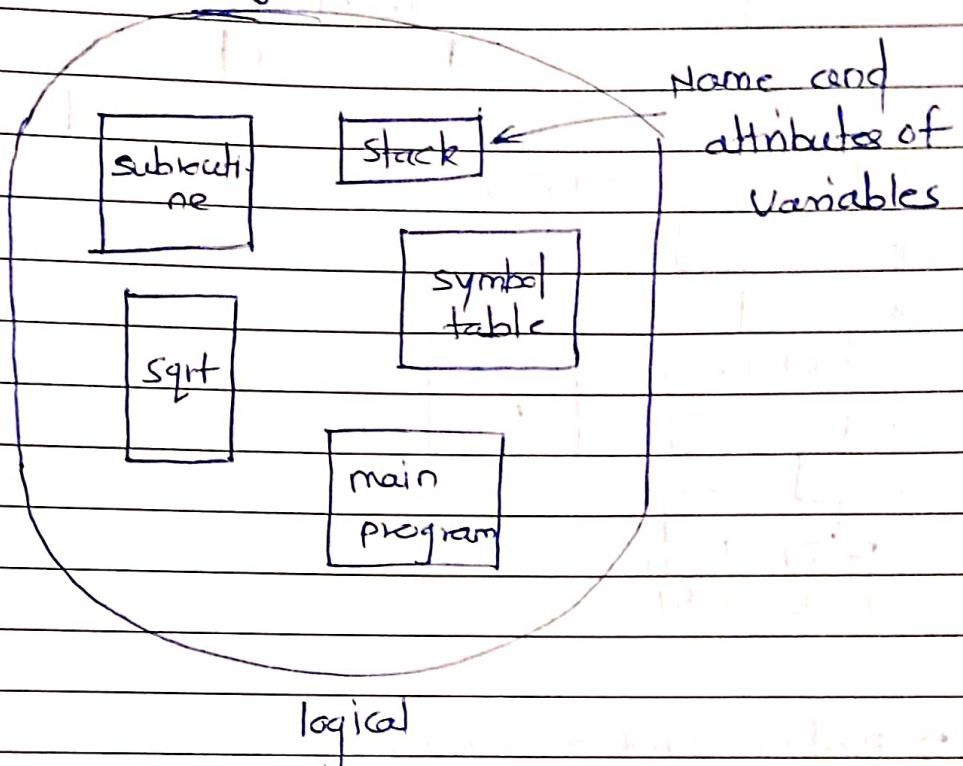

## ⇒ Thrashing:

- If a process does'nt have "enough" pages, the page fault rate is very high. This lead to:
  - low CPU utilization
  - Operating system thinks that it needs to increase the degree of multiprogramming.
  - another process added to the system.
- Thrashing = a process is busy swapping pages in and out.

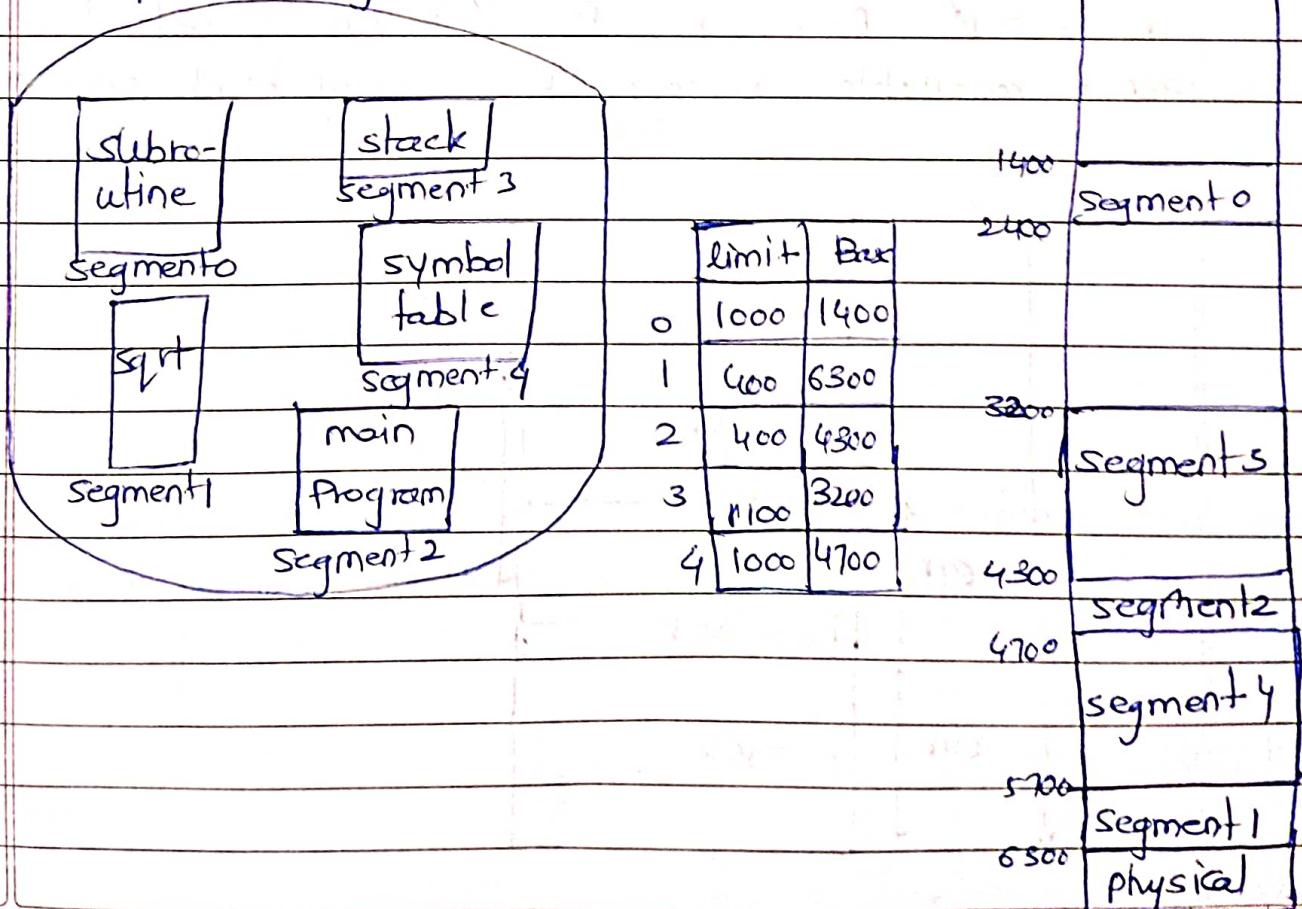

## ⇒ Segmentation

- memory management scheme that supports user view of memory
- A program is a collection of segments.
- A segment is logical unit such as:
  - main program
  - procedure
  - function
  - method
  - object
- local variables, global variables
- Common block
- Stack
- symbol table
- arrays.

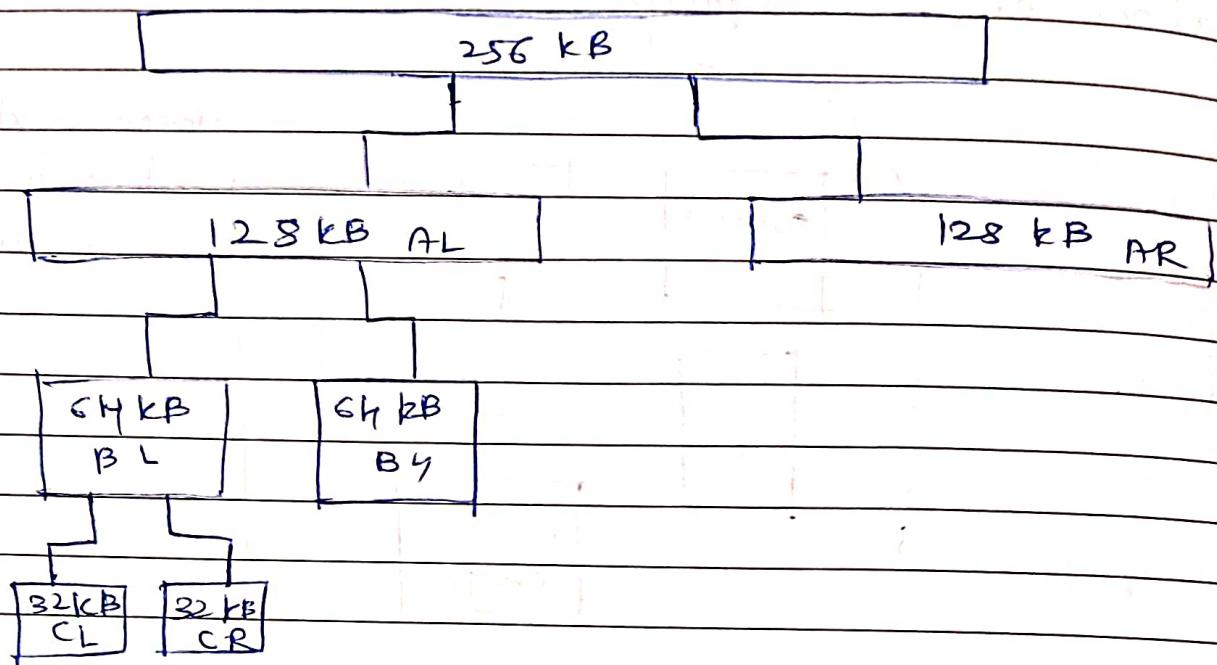

o) User's view of a program.

o) Example of segmentation

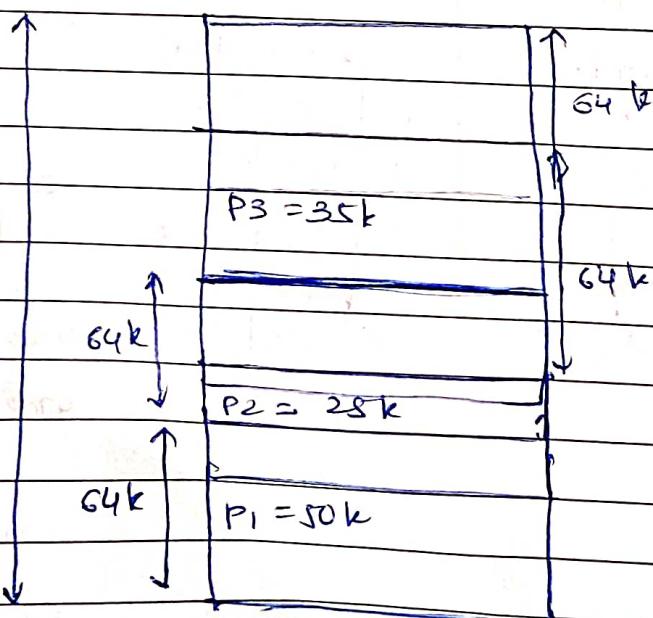

## → Buddy system Allocator

## ⇒ Buddy system example:

In Buddy system of memory management request of  $p_1 = 50k$ ,  $p_2 = 28k$ ,  $p_3 = 35k$  are satisfied with 256 k available memory. how many block size are left?

read - 4       $\frac{4+2+1}{7}$

PAGE No.	11
DATE	

## Module 5 :- Storage and file Management.

### File

o) file is continuous logical entity from secondary storage  
two major types are - data

data segment of binary program

object file

o) contents defined by file & creator are of many types  
e.g. text file  
source file  
executable file

o) following are the file attributes.

1. Name of file
2. file identifier - which will be unique tag number  
ii) used for indexing.
3. Type of file
4. location of the file & where the file located on device storage
5. size of the file
6. process protection & which will be read, write and execution
7. time, date and user identification

### File Operations

file is an abstract data type

1. create
2. write
3. read
4. Reposition within the file
5. delete
6. Truncate & delete the contents of the file without deleting file.
7. open (fi) :- search the directory structure on disk for entity fi and move the content of entity to memory.

7. close (fi) :- move the contents of file buffer

\* Open files :-

several places of data are needed to manage open files.

o) open-file table

o) file-open count

→ open-file table :- tracks open files.

→ file pointer :-

o) open file locking.

↳ shared lock - similar to reader lock      reader enter than writer lock but multiple reader access

↳ exclusive lock - similar to writer lock

→ Mandatory or advisory lock

→ mandatory :- access to desired denied depends on locks held and requested

→ advisory lock :- Processes can find status of locks and decide what to do.

o) Access lists and groups.

→ mode of access :- read, write, execute.

→ Three classes of user on unix / Linux.

a) owner access      7

R W X  
1 1 1

b) group access      6

R W X  
1 1 0

c) Public access      1

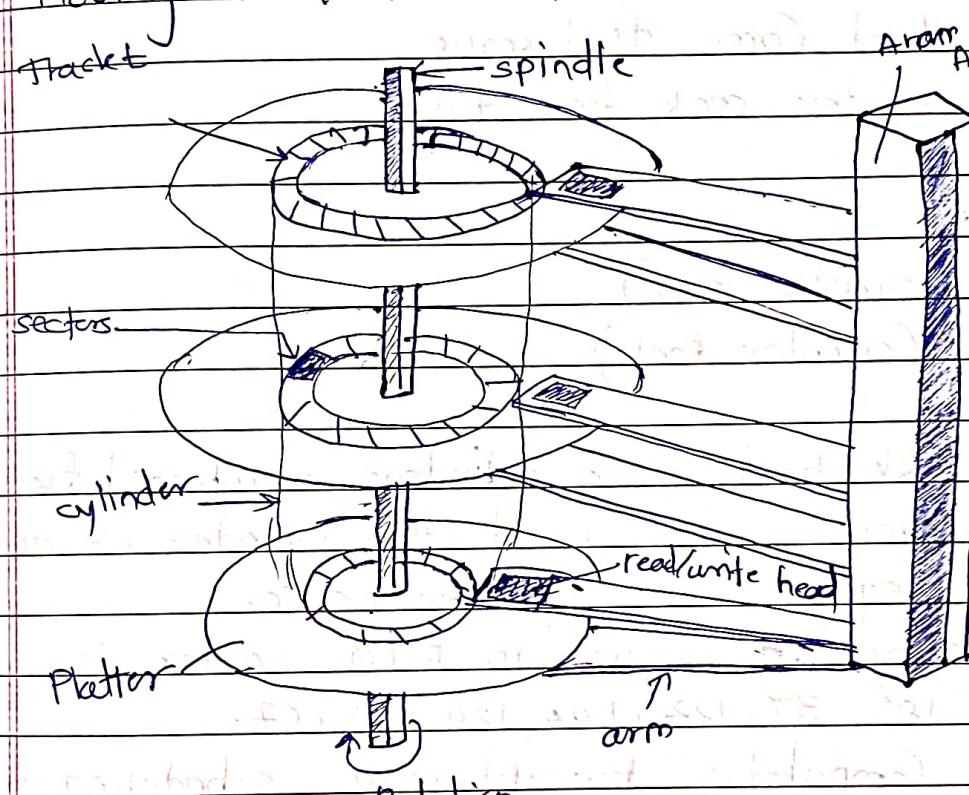

R W X  
0 0 1

owner      group      public

chmod 761 game.

→ Attach a group to file  
chgroup and game.

### \* Moving-head Disk Mechanism

P.P (physical address -  $1^\circ$  storage)  
(logical address -  $2^\circ$  storage)

- Data transfer will takes place between disk drive and processor
- platter diameter will be of 1.8 to 3.5 inch
- platter covers with magnetic materials from both sides.
- magnetic pattern from the platter is used for read and write purpose.
- magnet, write, rotates 60 to 300 per second which is called as rotation per minute.

o Common drive spins :-

o rotation speed relates to transfer speed

→ Disk scheduling

1) FCFS - first Come first serve

2) SSTF - shorter seek time first

3) SCAN

4) LOOK

5) C-SCAN (circular scan)

6) C-LOOK (circular look)

example Suppose disk having 200 cylinders numbered from 0-199. disk is currently serving at the cylinder no 53 and previous request is at cylinder no 60.

Queue of pending request in FIFO order is -

98, 183, 37, 122, 140, 124, 65, 67.

perform Computation for following scheduling algorithm

① FCFS ② SSTF ③ SCAN ④ LOOK ⑤ C-SCAN ⑥ C-LOOK

solution

① FCFS

→ Queue of pending request in FIFO

order is 98, 183, 37, 122, 140, 124, 65, 67

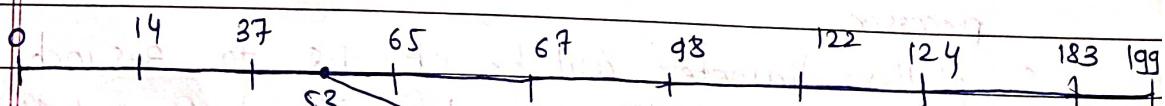

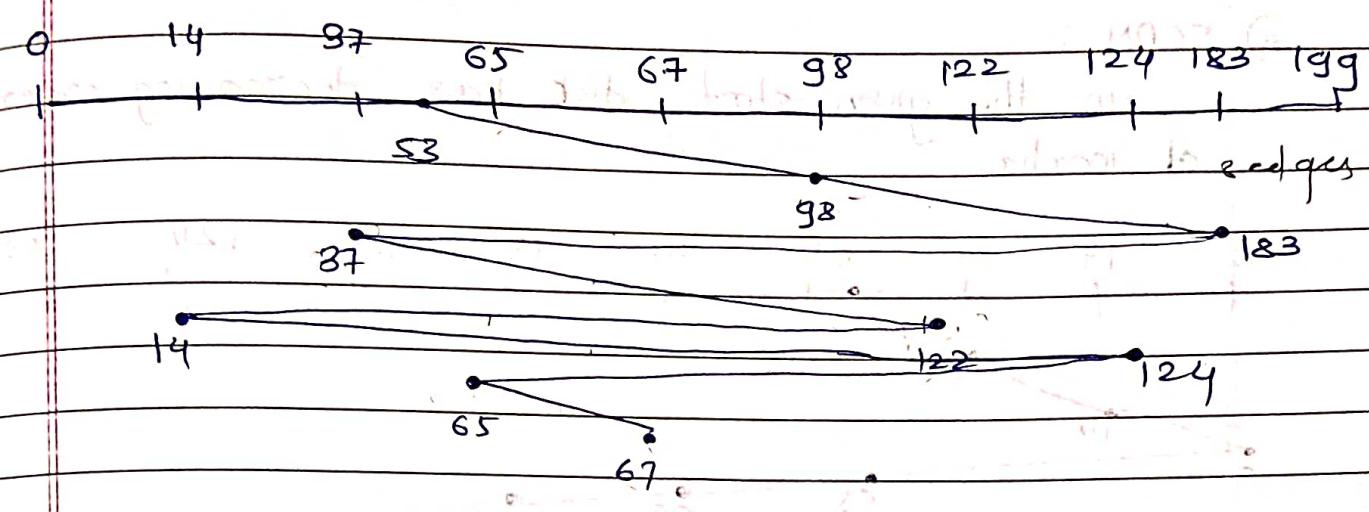

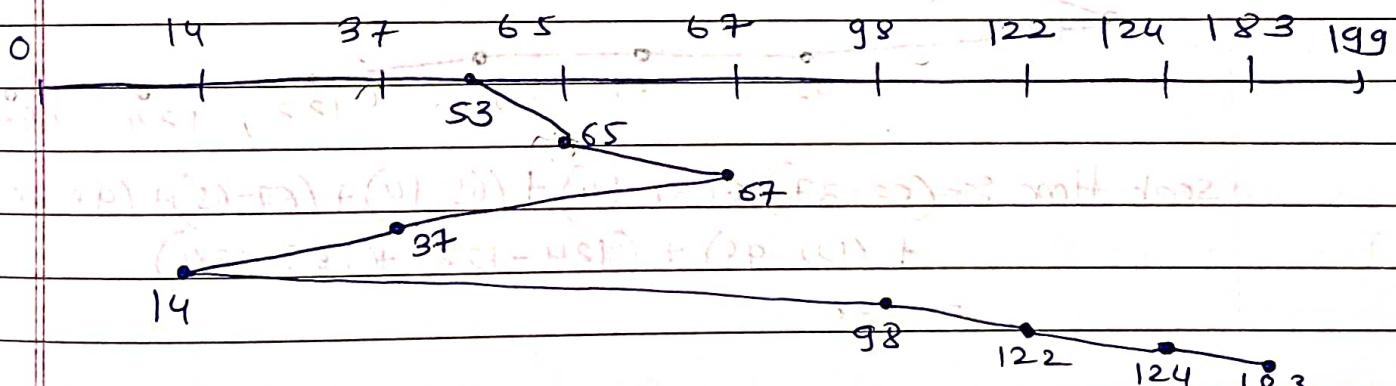

Diagram showing the sequence of cylinder requests for FCFS scheduling. The requests are 98, 183, 37, 122, 140, 124, 65, 67. The current position is at 53. The path starts at 53, moves right to 65, then left to 37, right to 122, right to 140, right to 124, left to 65, and finally left to 98.

$$\begin{aligned}
 \text{seek time} &= (98 - 53) + (183 - 98) + (87 - 122) + (122 - 14) \\
 &\quad + (183 - 37) + (122 - 37) + (122 - 14) + (124 - 14) \\
 &\quad + (124 - 65) + (67 - 65) \\
 &= 640
 \end{aligned}$$

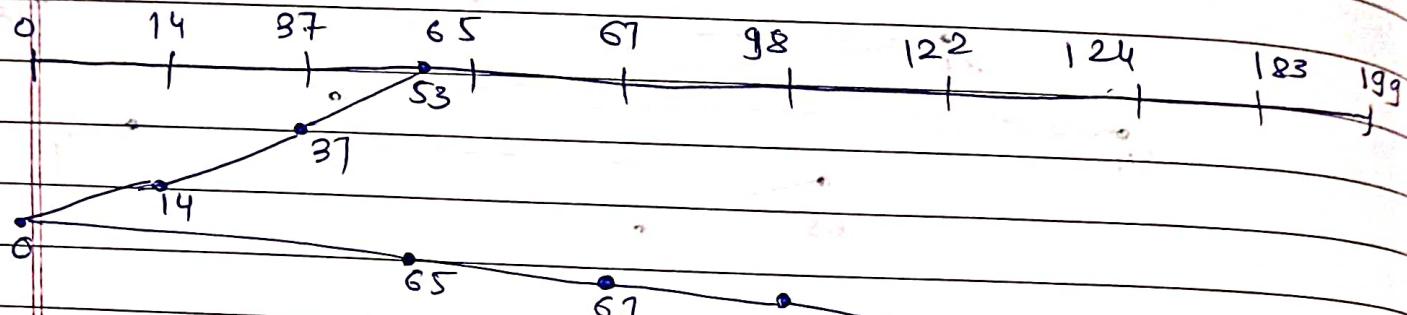

## 2] SSTF [Shortest seek time first]

$$\begin{aligned}
 \text{seek time} &= (65 - 53) + (67 - 65) + (67 - 37) + (37 - 14) + \\
 &\quad (98 - 14) + (122 - 98) + (124 - 122) + (183 - 124) \\
 &= 12 + 2 + 30 + 23 + 84 + 24 + 2 + 59 \\
 &= 236.
 \end{aligned}$$

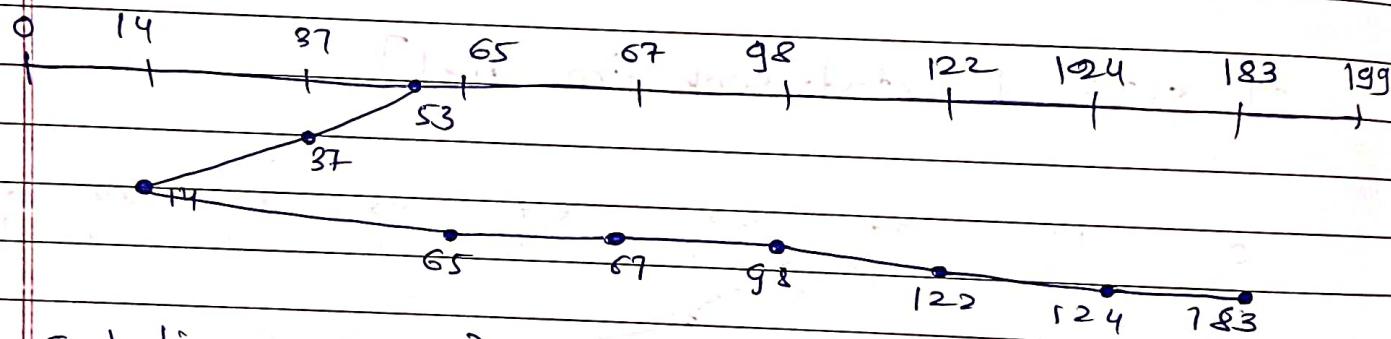

3) SCAN :-

In the given start disk has decreasing order of inertia.

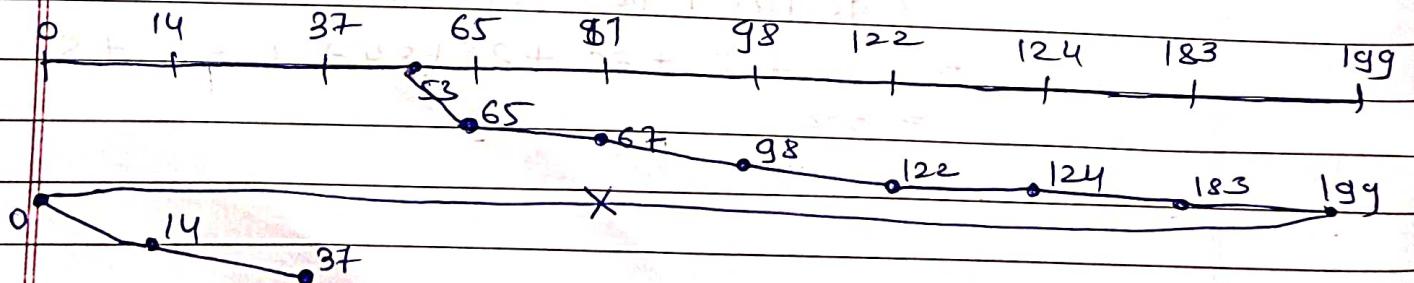

$$\text{seek time} = (53-37) + (37-14) + (14-0) + (65-0) + (67-65) + (98-67) + (122-98) + (124-122) + (183-124) = 236.$$

4) LOOK :-

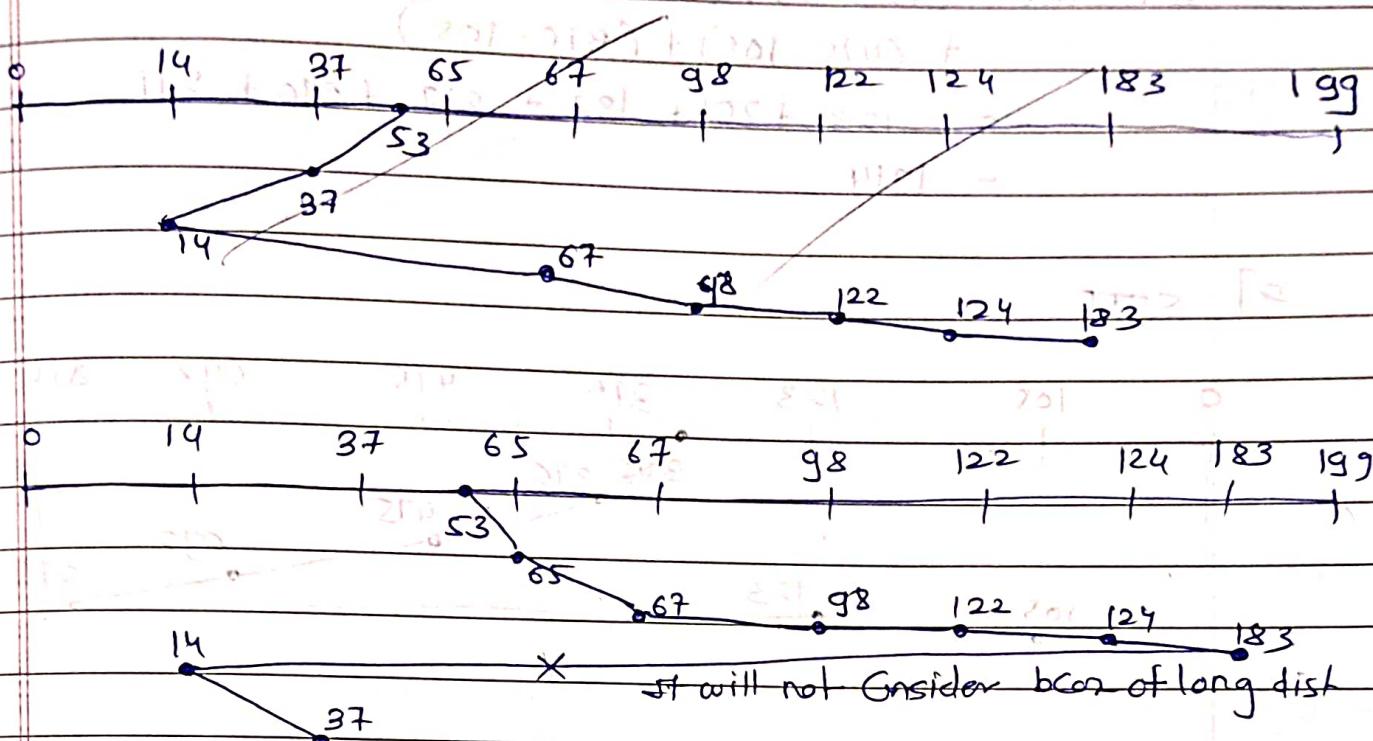

$$\text{seek time} = (53-37) + (37-14) + (65-14) + (67-65) + (98-67) + (122-98) + (124-122) + (183-124) = 208$$

5) C-SCAN

$$\text{seek time} = (65-53) + (67-65) + (98-67) + (122-98) + (124-122) + (183-124) + (199-183) + (199-0) + (0-14) = 183$$

6) (-LOOK S-SSR-SSR) + (S-FCFS) = with fcs

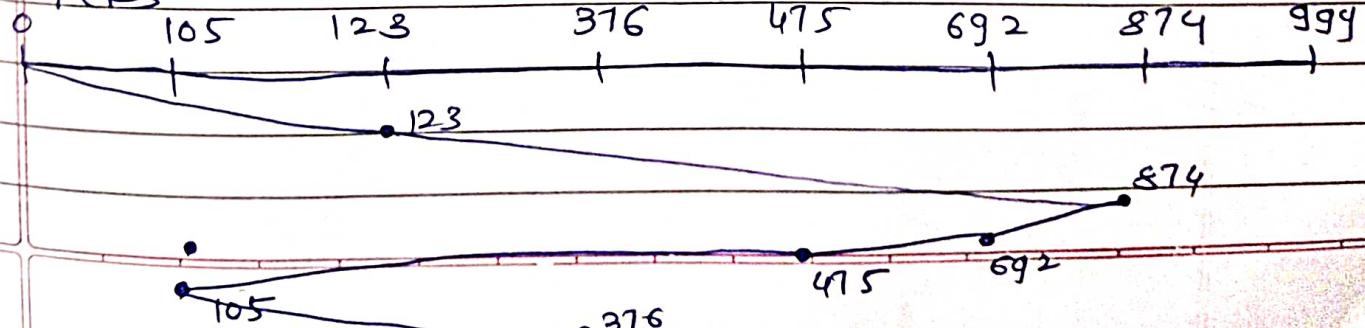

seek time :-  $(65-53) + (67-65) + (98-67) + (122-98) + (124-122)$   
 $+ (183-124) + (87-14)$

$$= 153$$

example-2 on disk of 1000 cylinders, number 0-999, Consider number of tracks that disk arm must move to satisfy all request in disk queue. Assume, th. last request received was at track 345 & head is moving toward track 0. The queue in FIFO order contains request for following track 123, 874, 692, 475, 105, 316

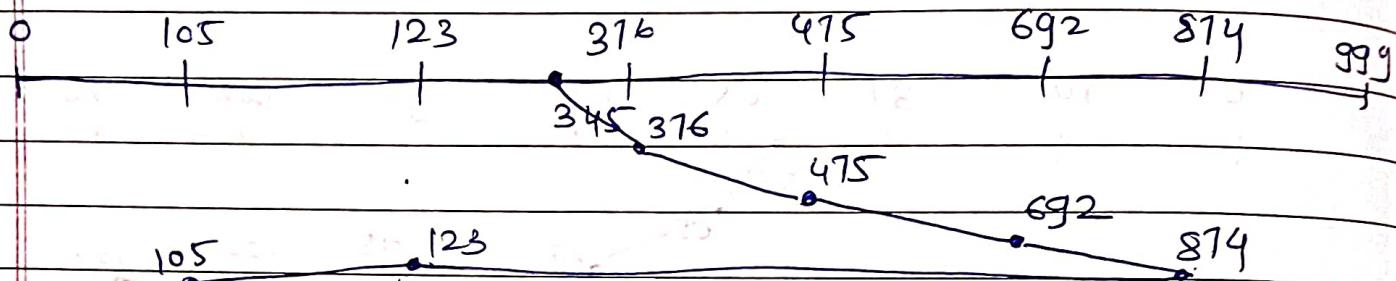

perform **a) FCFS** **b) SSTF** **c) SCAN** **d) Look**

→ FCFS

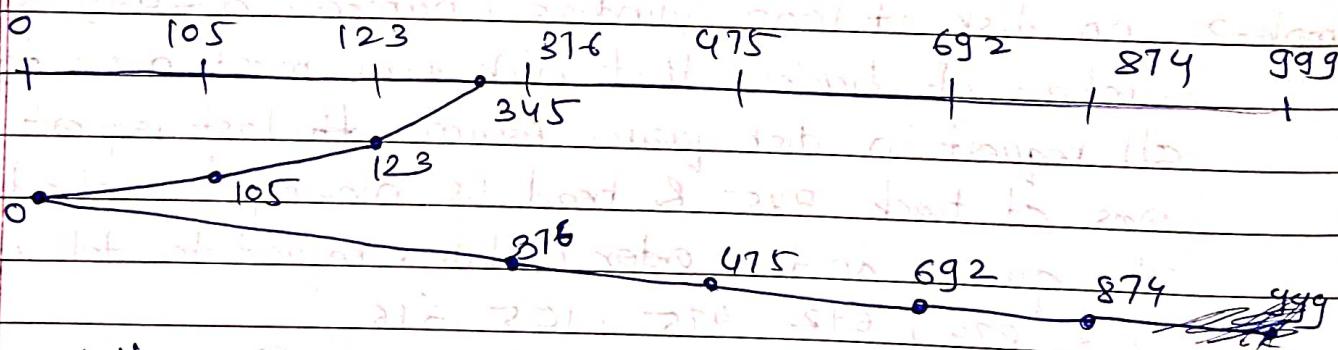

$$\begin{aligned}
 \text{seek time} &= (123-0) + (874-123) + (874-692) + (692-475) \\
 &\quad + (475-105) + (316-105) \\
 &= 123 + 751 + 182 + 217 + 310 + 271 \\
 &= 1914
 \end{aligned}$$

2] SSTF

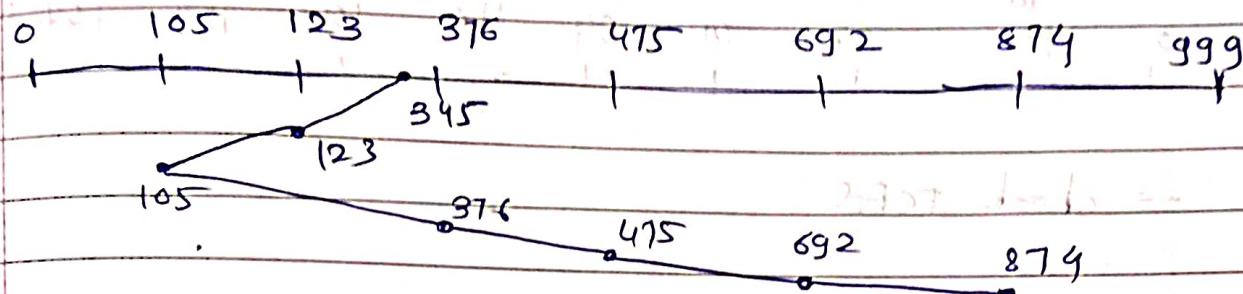

$$\begin{aligned}
 \text{seek time} &= (376-345) + (475-376) + (692-475) + (874-692) \\
 &\quad + (874-123) + (123-105) \\
 &= 31 + 99 + 217 + 182 + 751 + 18 \\
 &= 1298
 \end{aligned}$$

3] SCAN

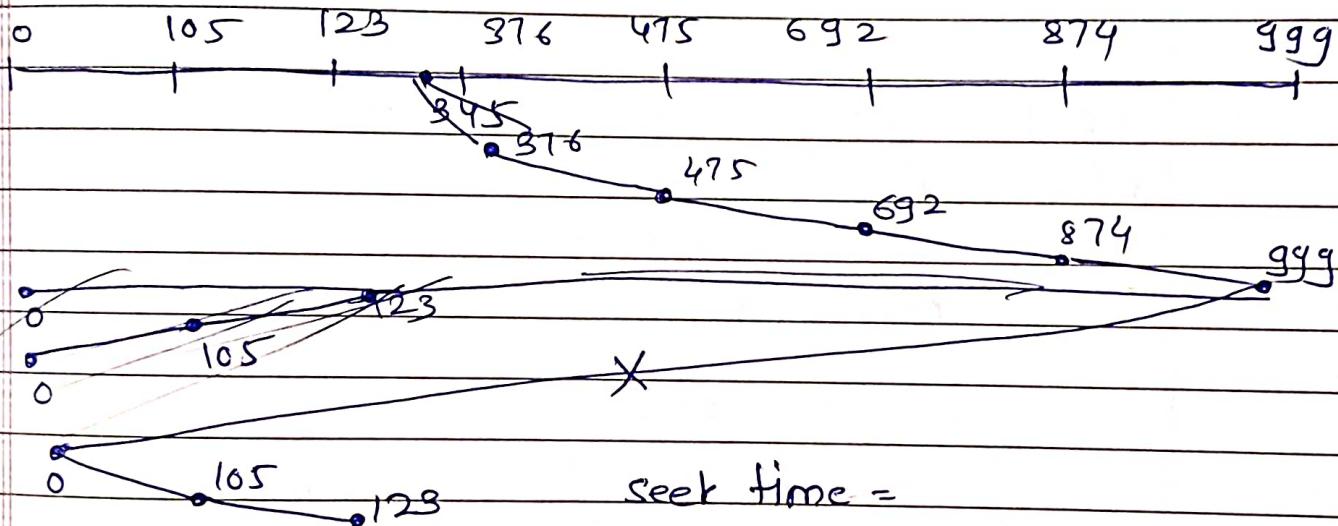

$$\begin{aligned}
 \text{seek time} &= 622 + 18 + 105 + 316 + 99 + 217 + 182 + \cancel{18} \\
 &= 1219
 \end{aligned}$$

4] LOOK :-

$$\begin{aligned} \text{Seek time} &= 222 + 18 + 271 + 99 + 217 + 182 \\ &= 1009. \end{aligned}$$

5] C-SCAN :-

6] C-Look :-

Q Write benefit/advantage of single and dual parity on data file in RAID-5 or RAID-6

PAGE No.	
DATE	/ /

## RAID Structure

It is redundant array of inexpensive/independent following types of RAID

1. → RAID - RAID - 0 Block striping
2. RAID - 1 disk mirroring
- RAID - 2 Bit striped
- RAID - 3 Bit striped with parity
- RAID - 4 Block striped
- RAID - 5 Block striped with parity
- RAID - 6 Distributed block with 2 parity.
- RAID - 01
- RAID - 10

] RAID - 0 [Block striping] : Data is written in the form of blocks

- RAID - 0  
Block is nothing but multiple bytes together

RAID - 0  
striping

- disadvantages :- if 1 drive fail then entire structure will be fail (drive failure)  
→ In drive failure won't be recover data

Compare & differentiate Raid-0 & Raid-1

advantages & disadvantages of raid-0 & raid-1

Compare raid 2 & raid 3

Compare raid 0 & raid 3

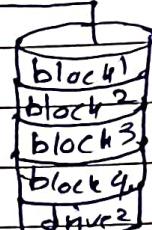

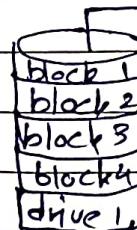

PAGE No.	
DATE	/ /

## 2) RAID-1: [Mirroring]

Data is written in terms of blocks

It is bit's

General concept

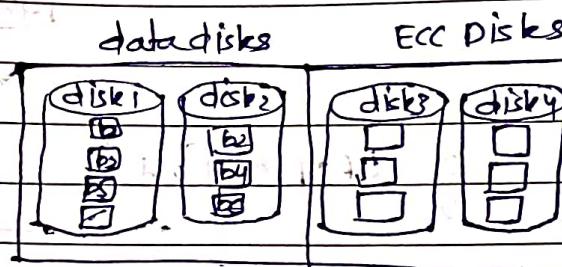

=

## 3) RAID-2 [Bit stripping]

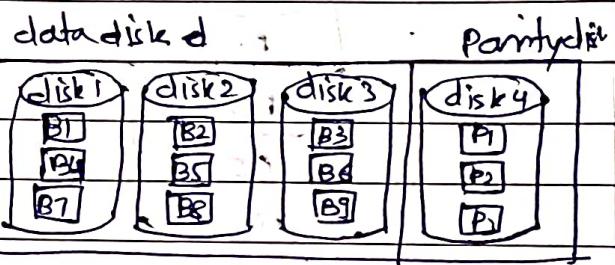

- Data is written in term of bits

- store error correction code

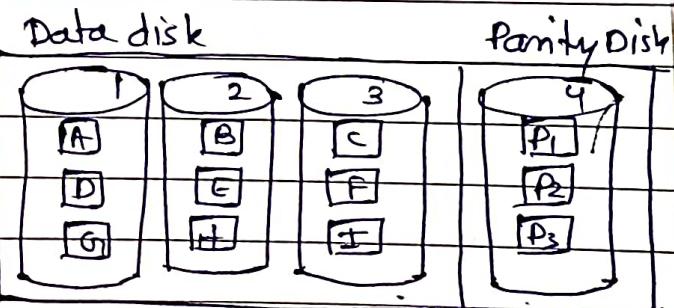

## 4) RAID-3 - [Byte striping]

- Data is written in terms of bytes

## 5) RAID-4 [Block striping] (Parity disk)

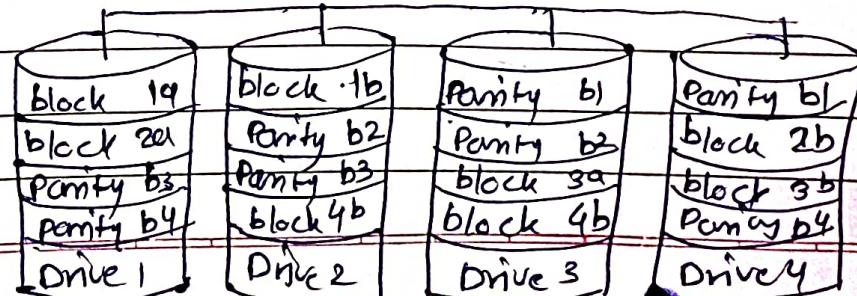

## 6) RAID-5 [striping with parity across drives]

- Block striping with one distributed parity

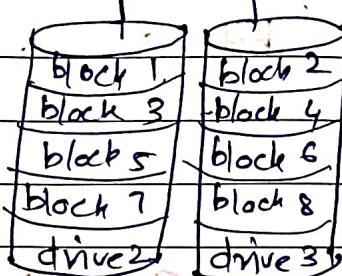

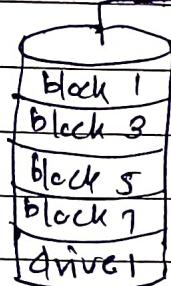

## 7) RAID-6

- Distributed block with 2 parity

Raid: lo(1+0)

## 8] RAID 10 (1+0)

q) RAJD-01 [0+1]
